

1. Definition of combinations and calculation formula.
2. Sample space. Examples
3. Definition of a random event, its notation. Examples
4. Definition of probability of an event, its notation. Examples
5. Classical definition of probability of an event. Examples
6. Properties of probability.
7. Definition of the sum of events. Examples
8. Definition of multiplication of events. Examples
9. Theorem of the addition of probabilities
10. Dependent and independent events. Examples
11. Conditional probability. Examples
12. Theorem of multiplication of probabilities.
13. Formula of a total probability.
14. Bayes' rule.
15. Discrete random variables. Examples
16. Continuous random variables. Examples
17. Binomial Distribution. Examples
18. Poisson Distributions. Examples
19. Jointly distributed random variables. Examples
20. The Uniform Random Variable. Examples
21. Gamma Distributions. Examples
22. Exponential Distribution. Examples
23. Normal Random Variable. Normal Distributions. Examples
24. The Chi-Squared Distribution. Examples
25. The sample mean. Examples
26. The Central Limit Theorem. Examples
27. The sample variance. Examples
28. The t – Distribution. Examples
29. The F - Distribution. Examples
30. Maximum Likelihood Estimation. Examples
31. Interval Estimates. Examples
32. Confidence intervals for a normal mean. Examples
33. CI for Bernoulli random variable. Examples
34. Hypothesis Testing. Examples
35. Significance levels. Examples
36. Tests on two means. Examples
37. Type I and Type II errors. Examples
38. p-value, t-Test. Examples
39. Testing means of a Normal Population. Examples
40. Simple linear regression model. Examples
41. Least squares and the fitted model. Examples
42. Properties of least squares estimators. Examples
43. Inferences for regression coefficients. Examples
